Challenge to Cross Industry Open Collaboration

18 December 2020
Yukio Ito
Chairman, Okinawa Open Laboratory
Senior Vice President, NEC

Contents

1. Introduction
2. Transit and Tourism Open Data
3. Data Utilization Use Cases Collaborating with NEC
4. End to End Network Slice Evaluation
5. 5G and IoT Projects Towards Next Generation Smart City
6. Wrap up

1 Introduction

Introduction

Okinawa Open Laboratory (OOL)

Vision: Social Innovation x Digital Technologies
Approaches: Open Technologies x Open Collaboration
Experiences: Technology Verification x Use Case Studies in Okinawa

- 5G x IoT
- End to End Network Slicing
- Data Utilization
- Open Data Platform
- Next Generation Smart City
- Collaboration for Various Use Cases in Data Utilization

OOL Contributes to Innovation for Society, Business and Personal Life in the New Normal Era
through its Open Approaches and Rich Experiences
Looking ahead to Beyond 5G

2 Transit and Tourism Open Data

Issues for Tourists

- Difficult to find the route data for travelling by public transportation like bus or monorail

- Poor information appeared on the well used web service like Google Maps

To Use Rental Car

Shuttle bus waiting queue
for rental car office
at the airport

To Use Taxi

Taxi waiting queue
at the cruise ferry terminal

Create an Open Data Platform

Open the <u>OTTOP</u> web site in August 2019

Okinawa Transit and Tourism Open data Platform

Publish and maintain the open data like
  - Timetables
  - Location of bus stops, stations, ports
  - Route data

for

  - Buses
  - Monorail
  - Ferries

in Okinawa

Data from 53 operators are published among 55 operators in Okinawa

After Publishing Open Data

Route data can be searched in Google Maps including ferries.

Reach to the destination via buses and ferries

Gathering Tourist Spots Data

OOL has gotten approval from all of cities, towns and villages in Okinawa (total 41 municipalities) to publish tourist spots data on the OTTOP gathered from local tourism associations which are published on the local websites respectively

Some of the gathered data can be gotten through APIs like
- A list of tourist spots
- Their detail data
- Reachable spots within a certain time period

These data will be added and expanded by discussing related parties and local associations

APIs on the OTTOP
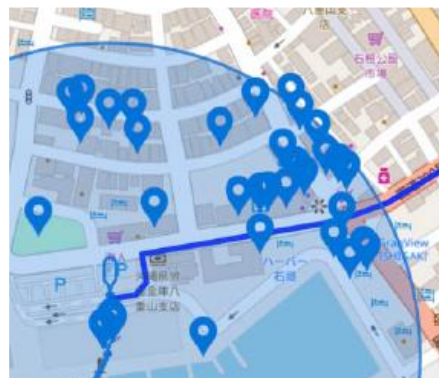

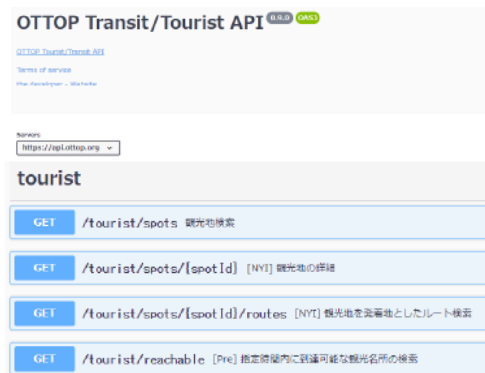

By using APIs, tourist spots and their detail data can be gotten and used by applications for tourist services like reachable spots within a certain time range

OTTOP Hackathon

To facilitate the usage of OTTOP, a Hackathon had held in December 2019 with 31 participants including young engineers and students
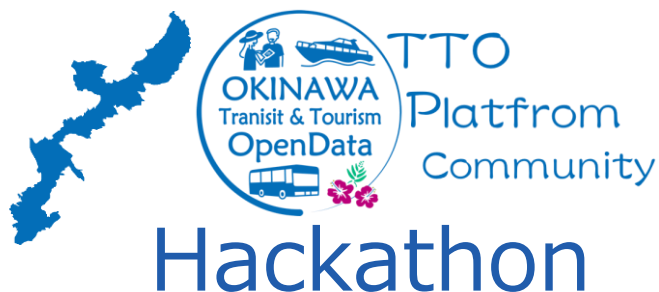

Following applications have developed in this hackathon
- Utilize free time for tourists
- My timetables
- Bus navigation for events
- Vacant parking space navigation
- Bus collection
- Smart bus navigation

Realtime Data Gathering

Realtime bus location data gathering feature will be added to OTTOP in FY2020 for the bus routes mainly used by tourists

GPS data gathering

Get the real time bus location

OTTOP
（静的なGTFSは過年度整備済）

Okinawa Transit Tourism OpenData Platform

GTFS realtime

Convert into GTFS-RT format

Feed to Google Maps

Open to the public usage as an open data
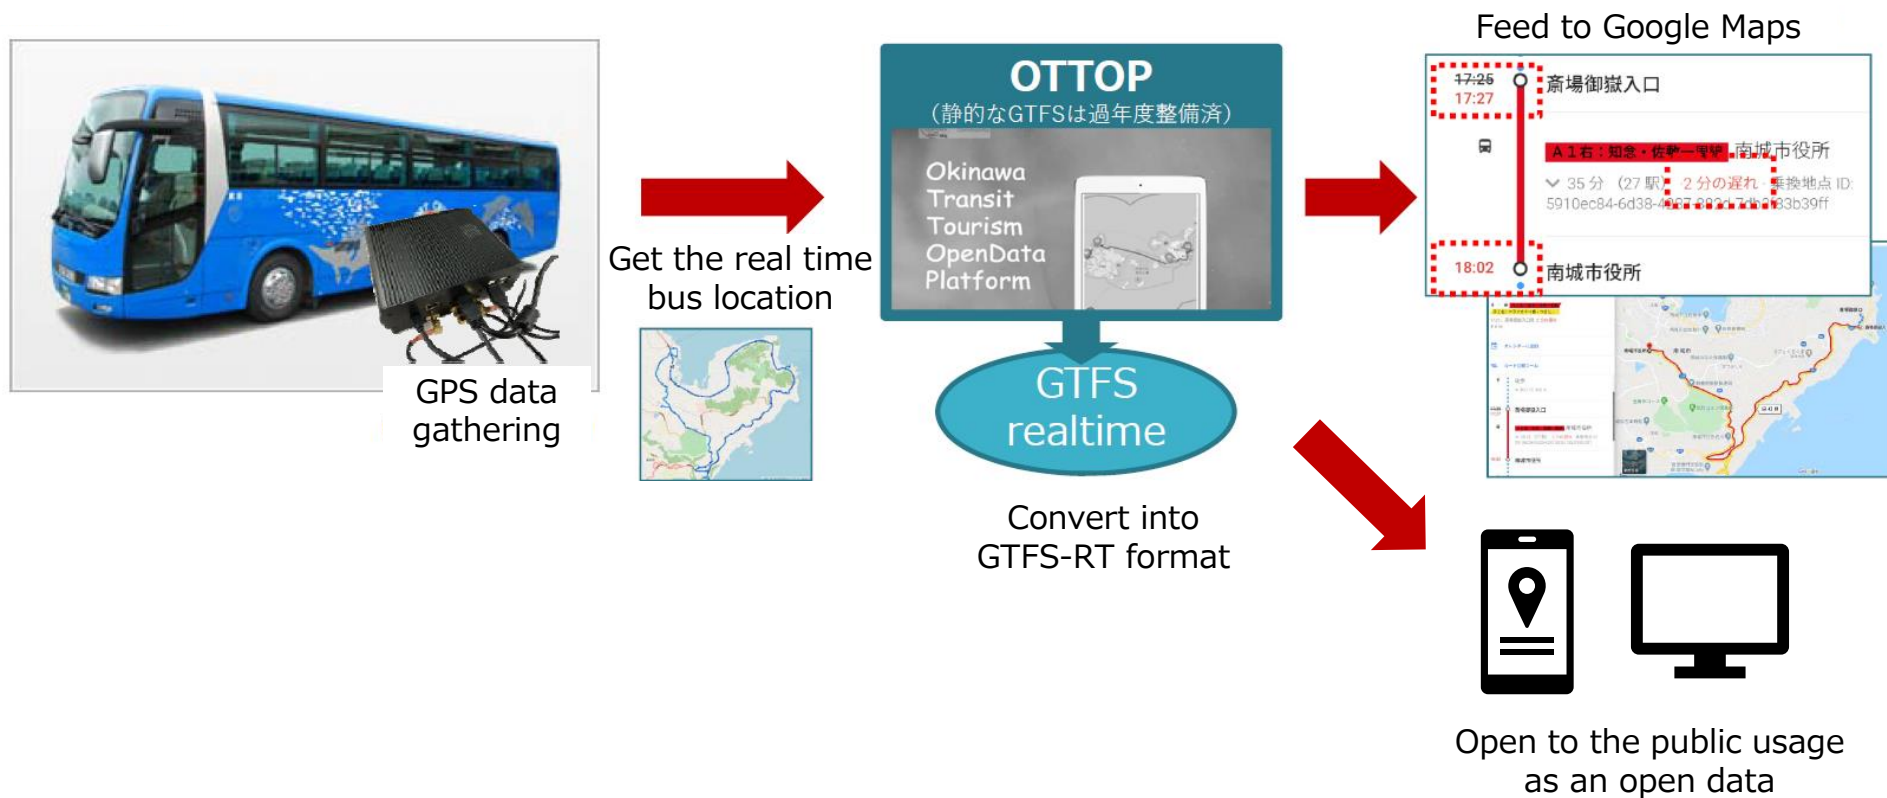

Tourists Travelling Data Gathering

Tourists travelling data are planned to be gathered in FY2020 to find out issues and to consider the future enhancement of data utilization

- Request for tourists to install a tour guidance application
- Get approval to acquire location and personal attribute data
- Gather personal attribute and GPS data through the application

- Lent a smartphone or tablet for rental car users
- Get approval to acquire location and personal attribute data
- Gather personal attribute and GPS data for rental car users

14

OTTOP Summary

Provide convenient services to end users
by open collaboration between cross industries

End users

Route guidance service by Google, Baidu, Yahoo!, Jordan, etc.

Various applications by local IT companies and service providers

OTTOP

Transport Open Data

Tourism Open Data

Okinawa Transit and Tourism Open data Platform

Transportation companies

Tourism associations Visitors Bureau

Okinawa Government

Support

Support

Support

Provides GUI for companies and organizations to maintain open data by themselves

3 Data Utilization Use Cases Collaborating with NEC

Planned in FY2021

Case 1 : Count the Number of People (Real Time)

▎Count the number of people at tour spots/shops by sensors and send data to the Smart IoT system, thus tourists can see the congestion status in real time

▎Public transportation operators can facilitate the usage of public transportation and can avoid opportunity loss by dynamic allocation of cars and busses according to the congestion status

① 観光客は混雑状況をポータル等より確認し観光施設を利用する事が可能
   （時間効率向上・三密回避）
② センサー情報により人数カウントを行い正確な混雑状況をSmart IoT側に格納。
③ 事業者は混雑状況をSmart IoTのリアルタイムデータ（混雑状況）よりピンポイントの場所への
   配車・増便が可能。（機会損失の削減）
   ※リアルタイムデータは、FIWAREポータルよりSmart IoTへフォワードされる想定。
④ 混雑の場所より観光客を乗車させる事が可能。（公共交通機関利用促進）
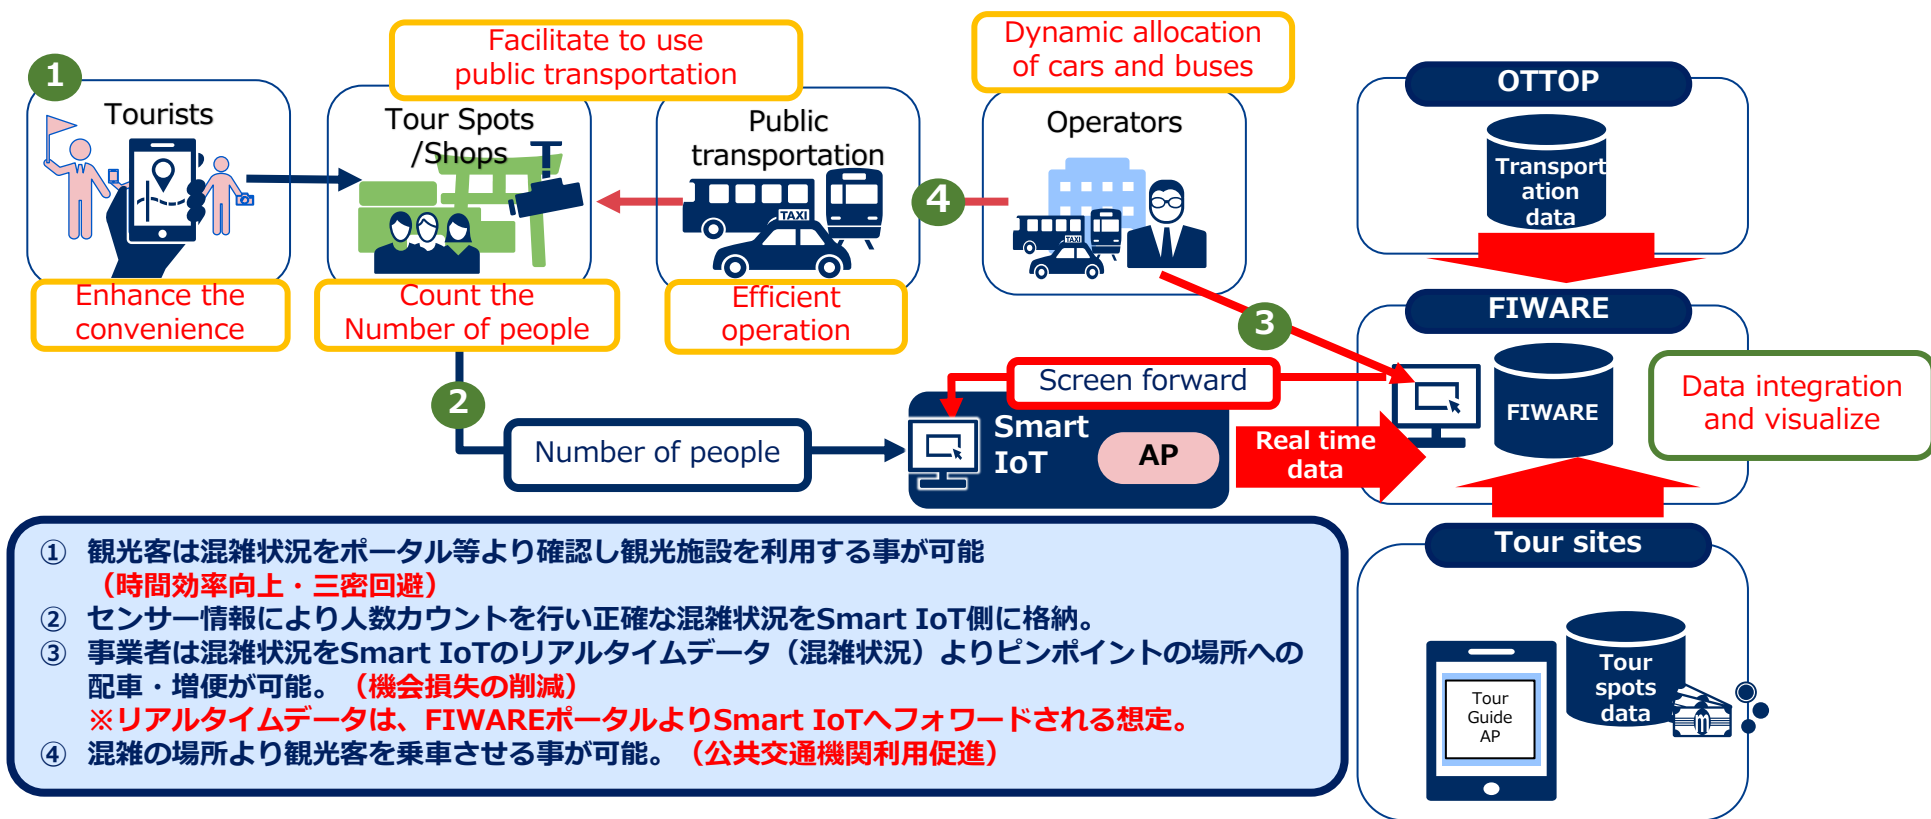

Case 2 : Accumulated Data Utilization

Public transportation operators can create more efficient and suitable routes and timetables by analyzing the accumulated data such as number of people at each place, date and time

① 公共交通事業者は、過去データより、日時・場所での傾向分析を行う事で、より正確な運行計画（時刻表改定、本数見直し、経路変更など）が可能。（事業効率向上、事業計画の正確性向上）
② 観光客は、最適化された運行計画により、観光地から、ほぼストレスフリーで公共交通機関の利用が可能。（観光利便性向上、公共交通機関利用促進）
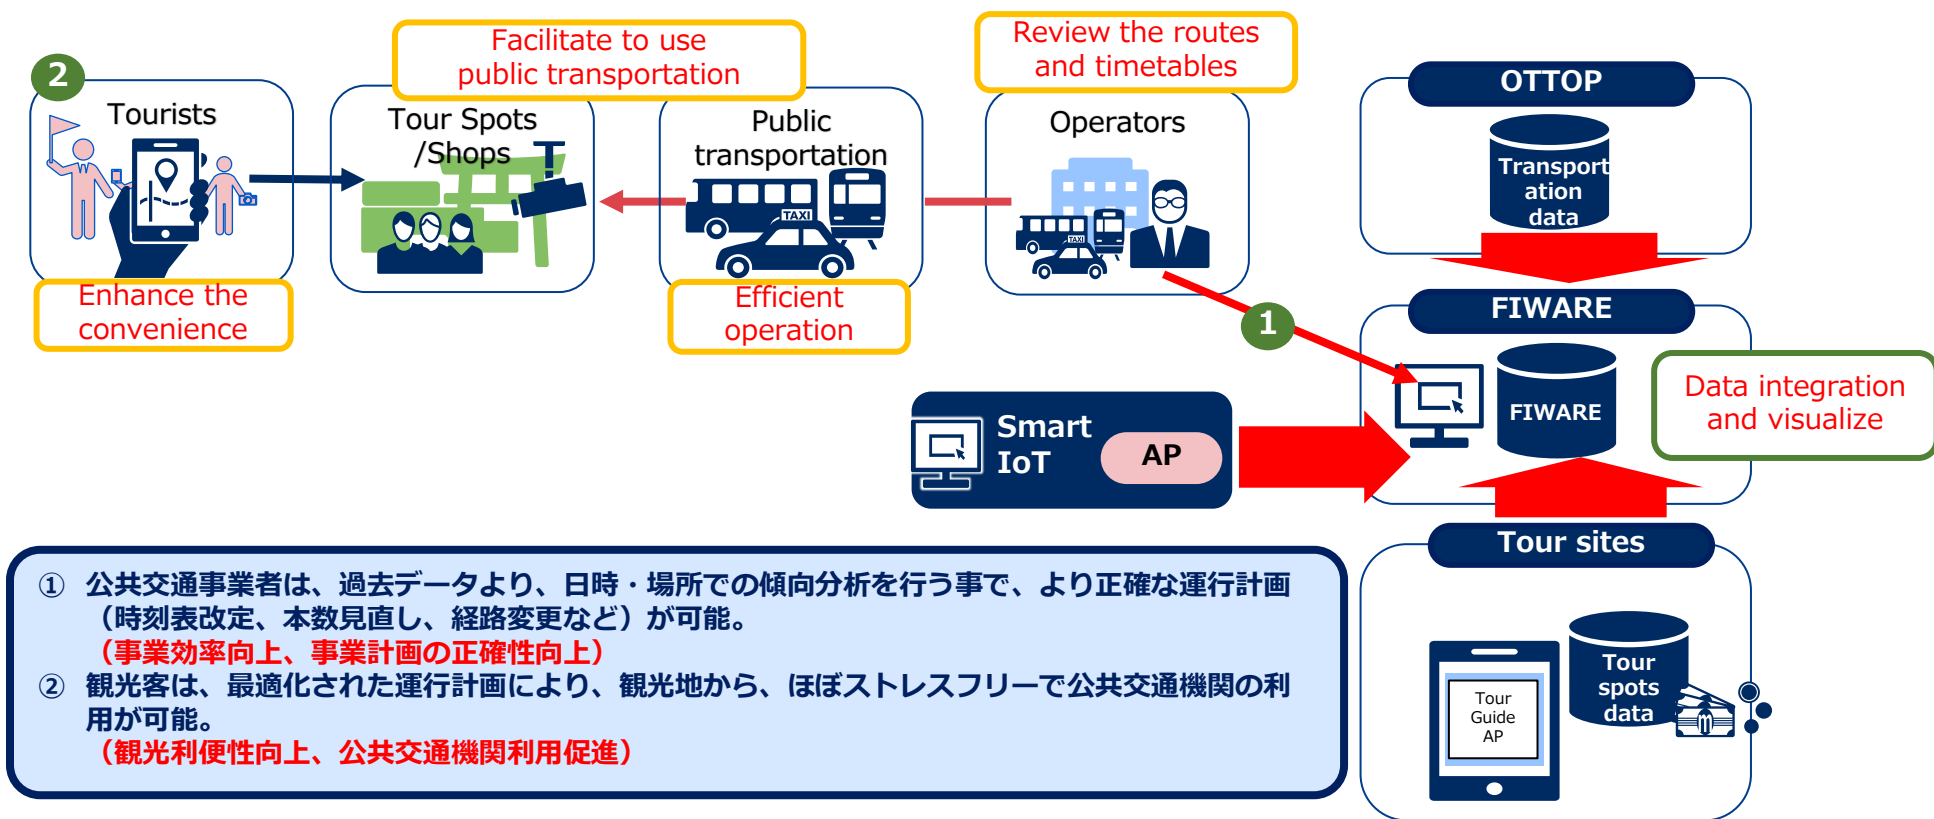

Case 3 : Utilize QR Code (Countermeasure for COVID-19)

▌ By scanning the QR code in public transportation and registering a feedback to the Smart IoT system, tourists can get infection information by email if the infection happens near the QR code

▌ Public transportation operators can also get the infection information including date, time and which cars, then the operators can take actions for the infection

① 観光客が公共交通機関に設置されたQRコード経由で自分のメールアドレスを含むフィードバックを登録。
② Smart IoTよりTACO連携により感染情報を観光客および公共交通事業者へリアルタイムでメール配信。感染情報データはFIWARE側にも蓄積データとして格納。
③ 感染情報より次の対策が可能。
　✓ 公共交通事業者：従業員のPCR検査・該当車両洗浄をタイムリーに感染対策可能。
　　　（従業員の不安払拭）
　✓ 観光客：タイムリーな感染対策可能（公共交通機関利用への不安払拭、安全・安心）

* TACO (Traveler's Access Center Okinawa) has been established in Naha Airport to support travelers for preventing infectious diseases
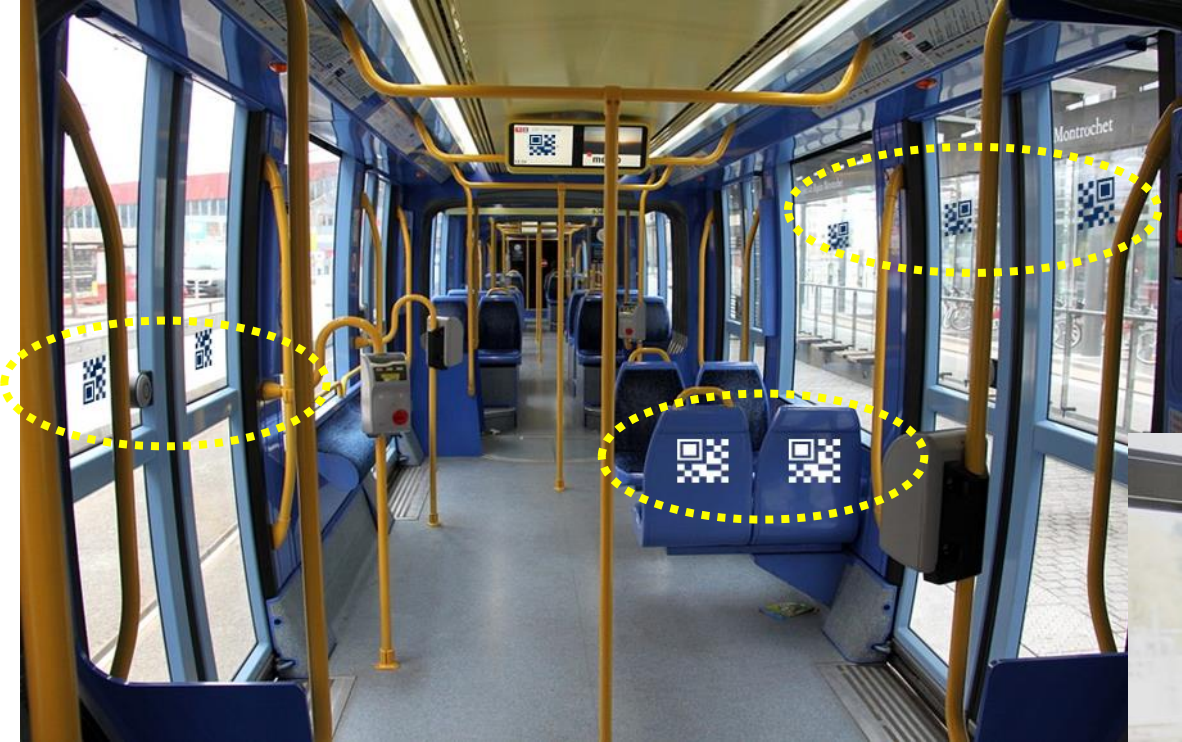

Case 4 : Utilize QR Code (Coupon/Mile Distribution)

- By scanning the QR code in public transportation and registering a feedback to the Smart IoT system, tourists can get coupons/miles to discount the public transportation and tour spots/shops
- Public transportation operators can improve routes and timetables and enhance services based on the feedback information

① 観光客が公共交通機関に設置されたQRコード経由で自分のメールアドレスを含むフィードバックを登録。
② 観光客はクーポン・マイルを受領（顧客満足度向上・リピート率向上）
③ 公共交通事業者がFIWAREポータル（フィードバック情報、観光客動線情報、GPS情報等）にアクセスし分析（運行計画最適化、サービス改善、宣伝収入改善、MaaS分析）
④ 公共交通機関のサービス改善、宣伝収入改善の実施（顧客満足度向上、宣伝収入向上）
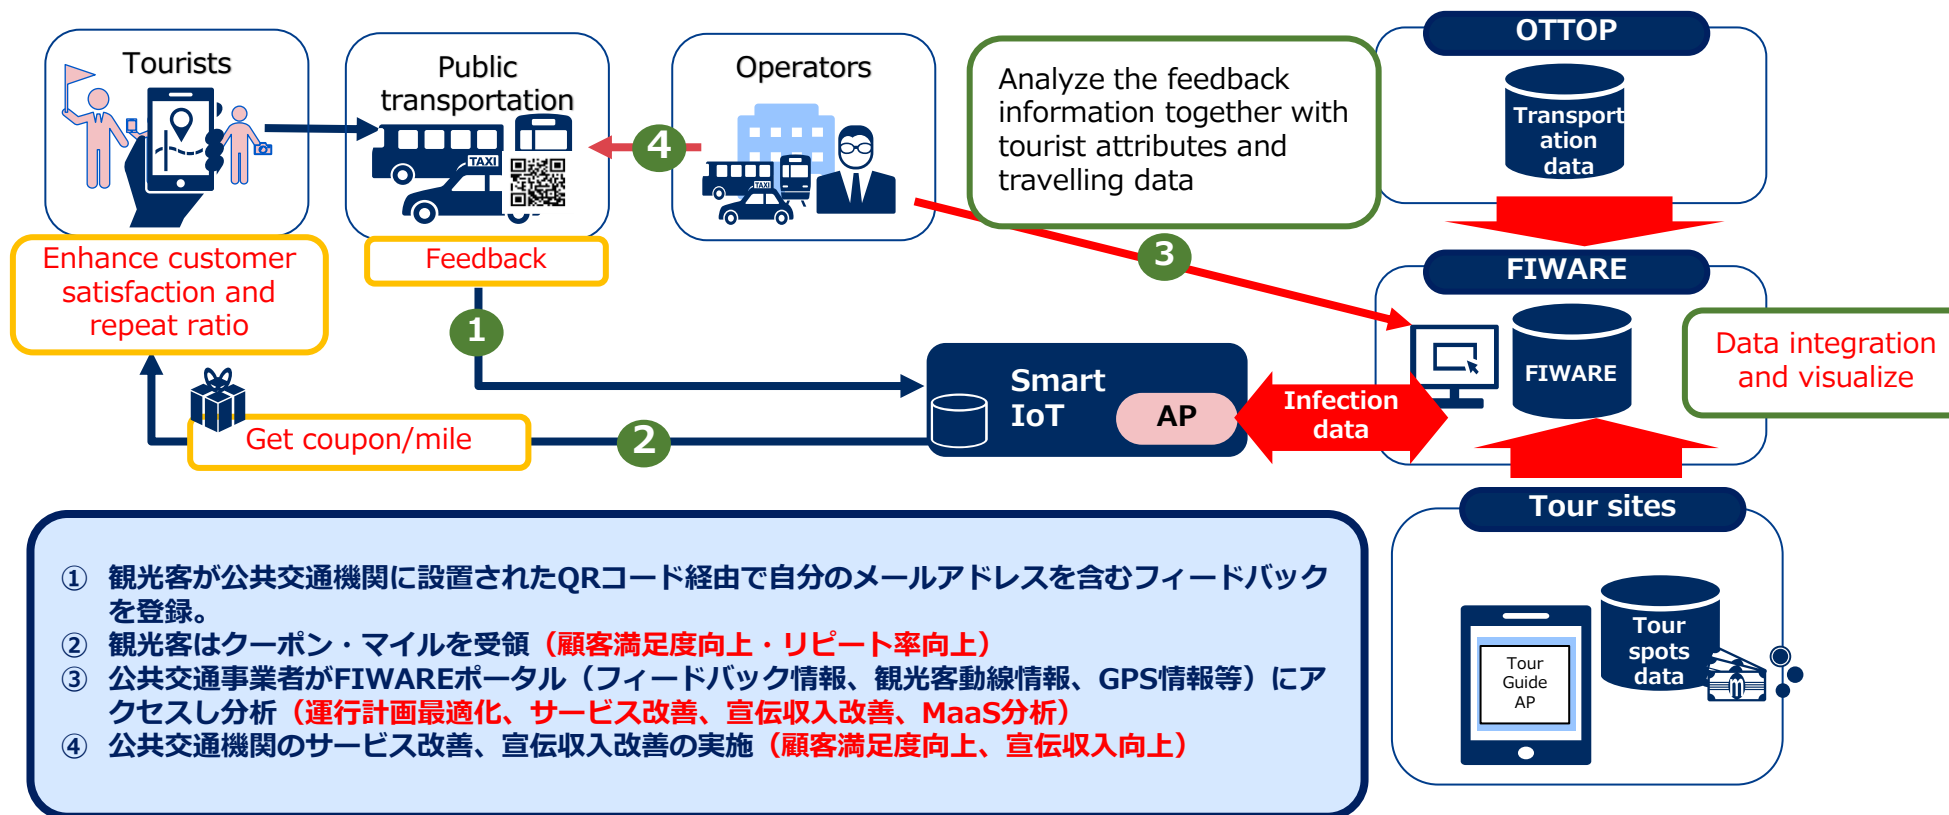

4 End to End Network Slice Evaluation

MEF 3.0 PoC in 2019

- Exhibited PoC "5G xHaul Sharing as Slices with LSO Orchestration" in MEF19
- Demonstrated network slicing and multi orchestrator/controller integration on multi operator inter-connection environment
- Won "Network Slicing Implementation Award 2019"

MEF19 PoC Network Diagram

5 5G and IoT Projects Towards Next Generation Smart City

Concept of Smart City

- Utilize the advanced technologies for urban development for citizens life and government services, etc.

- Make efficient for entire city

- Data exchange between various industries

Smart City

Citizens

City Services

Data utilization platform

AI

IoT

Advanced tech.

Big Data

Transportation data

Weather data

Disaster data

Government service data

Autonomous car

IoT devices

Drone

Open data

...

Requirements in Smart City (Infrastructure)

1. Platform needs to manage various kind of data and needs to develop services

2. Network needs to handle the huge data and real time events

...

Approach to Meet the Requirements

1. Platform needs to manage various kind of data and needs to develop services

   Evaluate the integration of data utilization platform FIWARE and FaaS (Function as a Service) feature for easy service development

2. Network needs to handle the huge data and real time events

   Utilize 5G Multi Access Edge Computing (MEC)
   - Locate the computing resource physically near place to the device or base station
   - Process the data or events at the MEC for those unnecessary to send to the cloud

# Approach in the IoT Project

- **Develop the Meteoroid to integrate the FIWARE and FaaS feature**
  - Meteoroid provides the event driven application execution environment in the FIWARE eco system utilizing FaaS (Apache OpenWhisk)

- **Evaluate a use case utilizing the Meteoroid integrating with 5G project network**
  - Use case : Digital signage control depends on the personal attribute

Use case

- Assume the entrance of stadium or airport

- Display the advertisement depends on the visitor's attribute (age)

- Collect the visitor's attribute by Field Analyst and notify to the FIWARE in every 3 sec.

- Control the signage depends on the attribute and count the number of visitors once a day

- Collected and counted data are stored into FIWARE in the cloud

- Advertisement data are gotten from object storage

6 Wrap up

- Key factors to succeed the open collaboration (from our experience)

    - Target oriented approach

    - Zero base thinking to consider the collaboration partners

    - Sufficient communications

    - Scheme, formation or system to keep sustainability

Thank you!!
